1.1 Application security Access

Application security Access mode provides engineering development with the ability to access information and features not available to the general diagnostic community. Data may be secured as data blocks or as individual bytes. For some data, reads may be unsecured while writes may be secured. Examples may include calibration data, configuration data, special engineering routines, etc.

1.2 Bootloader security Access

 $Bootloader\, security\, access\, mode\, is\, used\, for\, the\, sole\, purpose\, of\, reprogramming\, ECU\, flash\, memory.$

1) Bootloader security access mode shall only be used by ECUs which support flash 2) Bootloader security access mode is restricted to ECU flash reprogramming events and shall not be used for any other purpose.
